Please ensure that you have printed the page at the correct size by measuring the scale above.

Instructions
Once you have cut out the two arms of the bit measure, cut along these two lines to create two flaps which should go through the hole in the other arm to form the hinge of the bit measure (see the diagram).

The Correct Bit size for contented horses

The wrong size of bit causes pain to your horse. Use the bit measure to ensure you have the right size (a 1cm tolerance has already been included).

Please note that fixed cheek bits should be smaller than loose ring snaffles.
